

Activated Carbon Odour Breathing Filters are simple and cost effective solution used for odour emission control in small sewage treatment plants, sewage pumping stations and other waste treatment facilities. These filters are designed to receive gases without the use of fan and sized to meet the above requirements and ensure superior performance in removing odorous gasses. For demanding applications, same units may be used but capacities may vary as per detail design considerations.

EU-OF-AC units are constructed with black UV resistant High Density Polyethylene (HDPE). The Filters are designed to receive the contaminated air in at the bottom or from the side. The incoming air, pass through a demister for the separation of mist and water droplet. Purified air is released from the top of the unit after filtered by Activated Carbon bed.

The Activated Carbon Odour Breathing Filters are supplied as a compact package, easy to install and ready for operation.

ACTIVATED CARBON ODOUR BREATHING FILTERS

Disclaimer: The information contained on this data sheet is intended for general information only and should not be considered to be complete or definitive. S.K. Euromarket Ltd reserves the right to make changes at any time, without notice, to any element of the equipment presented.

AREAS OF APPLICATION

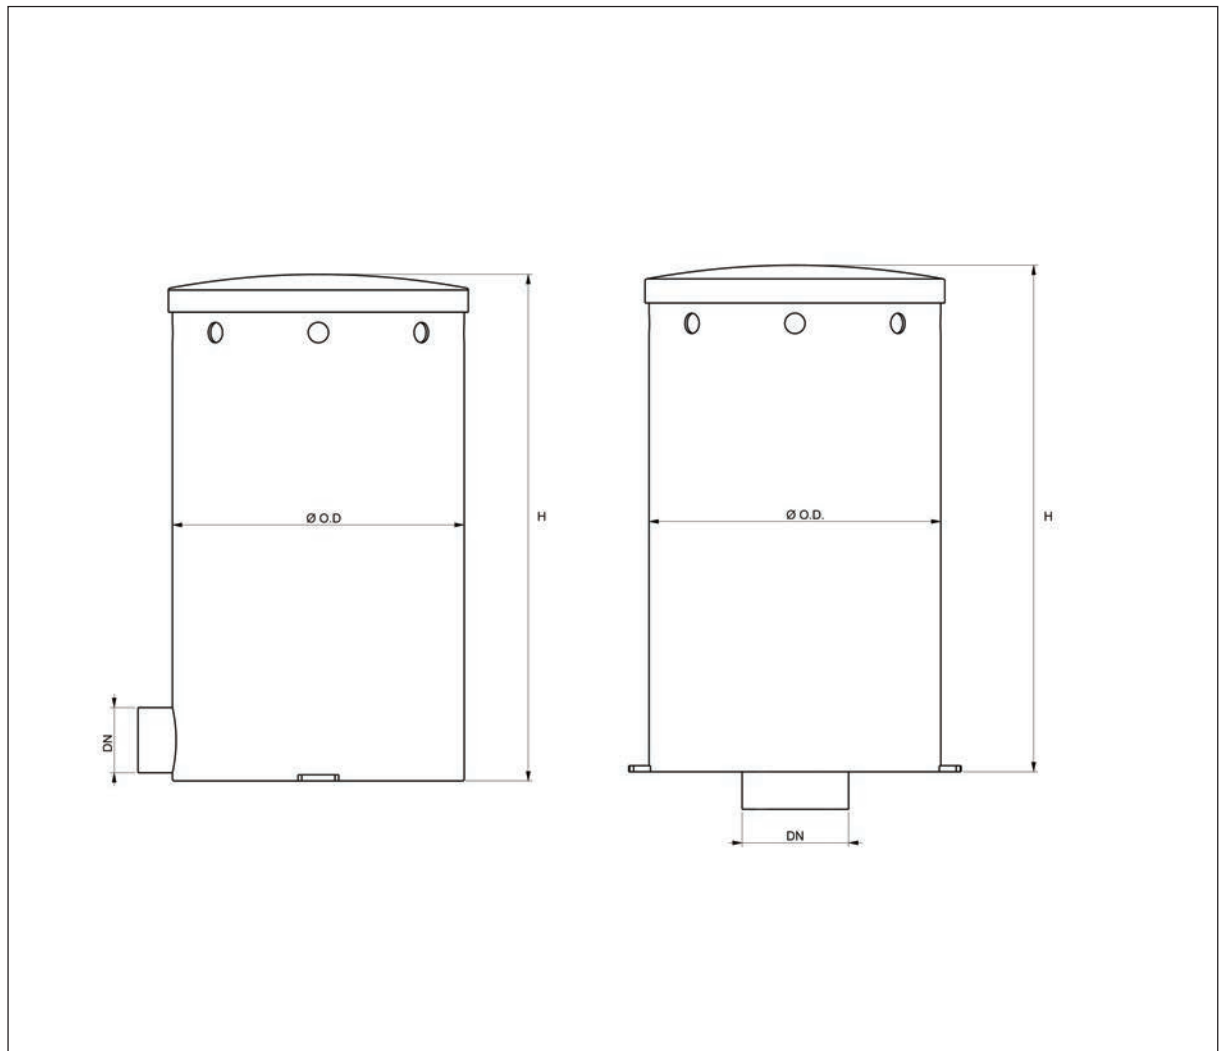

- Water treatment plants
- Sewage treatment plants
- Industrial effluent treatment plants
- Waste Treatment facilities

KEY FEATURES

- Complete compact unit
- Easy to install
- Ready for operation
- Indoor and outdoor installation
- Almost no maintenance required
